ALICE IN INDIANA: A FINANCIAL HARDSHIP STUDY

2020 INDIANA REPORT
The release of this ALICE Report for Indiana comes during an unprecedented crisis – the COVID-19 pandemic. While our world changed significantly in March 2020 with the impact of a global dual health and economic crisis, ALICE remains central to the story. The pandemic has exposed exactly the issues of economic fragility and widespread hardship that United For ALICE and the ALICE data work to reveal.

That exposure makes the ALICE data and analysis more important than ever. The ALICE Report for Indiana presents the latest ALICE data available – a point-in-time snapshot of economic conditions across the state in 2018. By showing how many Indiana households were already struggling, that snapshot provides the backstory for why the COVID-19 crisis is so damaging. The ALICE data is especially important now to help stakeholders identify the most vulnerable in their communities, and direct programming and resources to assist them throughout the pandemic and the recovery that follows. And as Indiana moves forward, this data can be used to estimate the impact of the crisis over time, providing an important baseline for changes to come.

This crisis is fast-moving and quickly evolving. To stay abreast of the impact of COVID-19 on ALICE households and their communities, visit our website at UnitedForALICE.org/COVID19 for updates.

Acknowledgements

Indiana United Ways and United Way of Central Indiana thank our partners and community stakeholders throughout the state for their support and commitment to this 2020 ALICE Report for Indiana. It is our hope that this Report will help raise awareness of the 37% of households in the state who live in poverty or who are ALICE — Asset Limited, Income Constrained, Employed. Our goal is to inform and inspire policy and action to improve the lives of ALICE families.

ALICE RESEARCH

ALICE Reports provide high-quality, research-based information to foster a better understanding of who is struggling in our communities. To produce the ALICE Report for Indiana, our team of researchers collaborated with a Research Advisory Committee composed of experts from across the state. In addition, every two years, United For ALICE undertakes a full review of the ALICE Methodology, in which Research Advisory Committee members from each of our partner states participate. This collaborative model ensures each Report presents unbiased data that is replicable, easily updated on a regular basis, and sensitive to local context.

ALICE: A GRASSROOTS MOVEMENT

This body of research provides a framework, language, and tools to measure and understand the struggles of a population called ALICE — an acronym for Asset Limited, Income Constrained, Employed. ALICE represents the growing number of households in our communities that do not earn enough to afford basic necessities. Partnering with United Ways, nonprofits, academic institutions, corporations, and other state organizations, this research initiative provides data to stimulate meaningful discussion, attract new partners, and ultimately inform strategies for positive change.

Based on the overwhelming success of this research in identifying and articulating the needs of this vulnerable population, this work has grown from a pilot in Morris County, New Jersey to 21 states and more than 648 United Ways. Together, United for ALICE partners can evaluate current initiatives and discover innovative approaches to improve life for ALICE and the wider community. To access Reports from all states, visit UnitedForALICE.org

WHAT’S NEW IN ALICE RESEARCH

Every two years, United For ALICE undertakes a full review of the ALICE Methodology to ensure that the ALICE measures are transparent, replicable, and current in order to accurately reflect how much income families need to live and work in the modern economy. In 2019, more than 40 external experts — drawn from the Research Advisory Committees across our United For ALICE partner states — participated in the review process. A full description of the Methodology and sources is available at UnitedForALICE.org/Methodology

This Report includes the following improvements:

More local variation: The ALICE budgets for housing, food, transportation, health care, and taxes incorporate more local data. For housing, we differentiate counties within Metropolitan Statistical Areas using American Community Survey gross rent estimates. For food, the U.S. Department of Agriculture’s Thrifty Food Plan is adjusted at the county level using Feeding America’s cost-of-meal data. For transportation, auto insurance is added to new mile-traveled data (discussed in the next paragraph) to reflect different driving costs by state. For health care, out-of-pocket costs are provided by census region. And taxes now systematically include local income tax, using data from the Tax Foundation.

Better reflection of household composition: Transportation and health care budgets now better reflect costs for different household members. The transportation budget for driving a car uses the Federal Highway Administration’s miles-traveled data, sorted by age and gender, and AAA’s cost-per-mile for a small or medium-sized car. The health care budget reflects employer-sponsored health insurance (the most common form in 2018, when it covered 49% of Americans1), using the employee’s contribution, plus out-of-pocket expenditures by age and income, from the Agency for Healthcare Research and Quality Medical Expenditure Panel Survey.

More variations by household size: The median household size in the U.S. is three people for households headed by a person under age 65 and two people for households headed by seniors (65+).2 Reflecting this reality, the Household Survival Budgets are presented in new variations, including a Senior Survival Budget. The website provides data to create budgets for households with any combination of adults and children. The ALICE Threshold has also been adjusted to incorporate the most common modern household compositions. These new budget variations are included in the County Profile and Household Budget pages on UnitedForALICE.org/Indiana

New ALICE measures:

• The Senior Survival Budget more accurately represents household costs for people age 65 and over. Housing and technology remain constant; however, some costs are lower — transportation, food, and health insurance premiums (due to Medicare) — while others are higher, especially out-of-pocket health costs. Because over 90% of seniors have at least one chronic condition, the Senior Survival Budget includes the additional cost of treating the average of the five most common chronic diseases.

• The ALICE Essentials Index is a standardized measure of the change over time in the costs of essential household goods and services, calculated for both urban and rural areas. It can be used as a companion to the Bureau of Labor Statistics’ (BLS) Consumer Price Index, which covers all goods and services that families at all income levels buy regularly.

Data Notes: The data are estimates; some are geographic averages, others are one- or five-year averages depending on population size. Change-over-time ranges start with 2007, before the Great Recession, then measure change every two years from 2010 to 2018. County-level data remains the primary focus, as state averages mask significant differences between counties. For example, the share of households below the ALICE Threshold in Indiana ranges from 21% in Hamilton County to 47% in Crawford and Monroe counties. Many percentages are rounded to whole numbers, sometimes resulting in percentages totaling 99% or 101%.

The methodological improvements included in this Report have been applied to previous years to allow for accurate year-over-year comparisons. This means that some numbers and percentages at the state and county level will not match those reported in previous ALICE Reports for Indiana.
LETTER TO THE COMMUNITY

Dear Fellow Hoosiers,

In the coming days, Indiana United Ways will release its fourth ALICE Report. Since 2014, we have been tracking the financial well-being of Hoosiers throughout the state, and this update on the number of our citizens that are in financial need is concerning. The data that we will be releasing on ALICE, shorthand for Asset Limited, Income Constrained, Employed, is the most comprehensive data set at this level of detail across all communities in the state.

The ALICE Report gives us a rearview mirror snapshot of the financial condition of our fellow Hoosiers in 2018. In a time when many Indiana residents were experiencing growth in their investment portfolios or booming business, our fourth ALICE Report reminds us that in 2018, about 4 in 10 Hoosiers continued to struggle to make ends meet, and another 11% of Hoosiers were above the ALICE threshold but “at-risk” — little more than one emergency away from not being able to keep up with bills or possibly struggling to keep food on the table.

Now, as we are in the midst of an unprecedented public health crisis, which has impacted the way we work, learn, shop, play, and interact with community for the foreseeable future, we expect even more Hoosier families to become ALICE. Within a couple of months of Governor Eric Holcomb’s announcement of the Covid-19 public health emergency, we saw unemployment in our state go from under 3% in many counties to five times that amount, as local employers, schools, health care systems, and elected officials grappled with how to keep Hoosiers safe from this unpredictable virus that can be deadly for some.

The ALICE data paints a far more complex picture for about half of us. ALICE workers may be in the position of being deemed essential workers but in jobs that put them at increased risk of exposure like those cleaning hospital rooms, processing our meat, or delivering our dinners. Families with good jobs last winter likely didn’t have a plan in place to deal with furloughs, the permanent shuttering of an employer, or not having their children safe and learning at school or daycare.

Amidst the uncertainty, United Ways in Indiana and our partners haven’t stopped their work. We continue to energetically lead the fight for our ALICE families, ensure access to healthy food and safe housing, help make sure child care centers have support to reopen, and coach families on crisis budgeting. The 2018 ALICE Report will help us to engage elected officials, business owners, our donors, and volunteers in that fight. Over the last few months, many of us have looked forward to “getting back to normal” — this report reminds us that “normal” wasn’t working for close to half of Indiana residents. We invite you to join us in creating a new normal that raises the tide for all of us.

Sincerely

Ron Turpin, Chair, Board of Directors, Indiana United Ways

Figure 12 .............................................................................................................................................................................. 36
From 2010 to 2018, Indiana showed steady economic improvements according to traditional measures. Unemployment in the state and across the U.S. fell to historic lows, GDP grew, and wages rose slightly. Yet in 2018, eight years after the end of the Great Recession, 37% of Indiana’s 2,592,262 households still struggled to make ends meet. And while 13% of these households were living below the Federal Poverty Level (FPL), another 24% — almost twice as many — were ALICE households: Asset Limited, Income Constrained, Employed. These households earned above the FPL, but not enough to afford basic household necessities.

This Report provides new data and tools that explain the persistent level of hardship faced by ALICE households, revealing aspects of the Indiana economy not tracked by traditional economic measures. The Report highlights three critical trends:

• **The cost of living is increasing for ALICE households.** From 2007 to 2018, the cost of household essentials (housing, child care, food, transportation, health care, and technology) increased faster than the cost of other goods and services. The ALICE Essentials Index, a new tool that measures change over time in the cost of essentials, increased at an average rate of 3.4% annually nationwide over the past decade, while the official rate of inflation was 1.8%.

• **Worker vulnerability is increasing while wages stagnate in ALICE jobs.** By 2018, a near-record-low number of people were reported to be unemployed. However, that low unemployment concealed three trends that expose ALICE workers to greater risk: growth in the number of low-wage jobs, minimal increases in wages, and more fluctuations in job hours, schedules, and benefits that make it harder to budget and plan. These trends were clear in 2018: A record number of Indiana workers — 59% — were paid by the hour, and 66% percent of the state’s jobs paid less than $20 per hour.

• **The number of ALICE households has increased in Indiana** as a result of rising costs and stagnant wages. There are more ALICE households than households in poverty, and the number of ALICE households is increasing at a faster rate. The FPL, with its minimal and uniform national estimate of the cost of living, far underestimates the number of households that cannot afford to live and work in the modern economy. In Indiana, the percentage of households that were ALICE rose from 16% in 2007 to 24% in 2018, while the percentage of poverty-level households remained relatively flat, increasing slightly from 12% to 13% during that time period.

This Report provides critical measures that assess Indiana’s economy from four perspectives: They track financial hardship over time and across demographic groups; quantify the basic cost of living in Indiana; assess job trends; and identify gaps in assistance and community resources. These measures also debunk assumptions and stereotypes about low-income workers and families. ALICE households are as diverse as the general population, composed of people of all ages, genders, races, and ethnicities, living in rural, urban, and suburban areas.

The Report concludes with an analysis of the economic benefits if all households had income above the ALICE Threshold. Not only would there be a significant positive impact on families and their communities, but the state economy would also benefit. In fact, the added value to the Indiana GDP would be approximately $57.5 billion.

This Report and its measures are tools to help stakeholders ask the right questions, reduce vulnerabilities, remove obstacles to advancement, identify gaps in community resources, build a stronger workforce, and implement programs and policies that help put financial stability within reach for ALICE households. With the magnitude of financial hardship revealed, these actions can help move all households toward a more equitable economy, and ensure that no one is left behind in harder times.
ALICE is an acronym that stands for Asset Limited, Income Constrained, Employed — households with income above the Federal Poverty Level but below the basic cost of living. A household consists of all the people who occupy a housing unit. In this Report, households do not include those living in group quarters such as a dorm, nursing home, or prison.

The Household Survival Budget estimates the actual bare-minimum costs of basic necessities (housing, child care, food, transportation, health care, and a basic smartphone plan) in Indiana, adjusted for different counties and household types.

The Senior Survival Budget incorporates specific cost estimates for seniors for food, transportation, and health care, reflecting key differences in household expenses by age.

The Household Stability Budget calculates the costs of supporting and sustaining an economically viable household over time, including a contingency for savings.

The ALICE Threshold is the average income that a household needs to afford the basic necessities defined by the Household Survival Budget for each county in Indiana. Households Below the ALICE Threshold include both ALICE and poverty-level households.

The ALICE Essentials Index is a measure of the average change over time in the costs of the essential goods and services that households need to live and work in the modern economy — housing, child care, food, transportation, health care, and a smartphone plans.
WHO IS ALICE?

With income above the Federal Poverty Level (FPL) but below a basic survival threshold — defined as the ALICE Threshold — ALICE households earn too much to qualify as “poor” but are still unable to make ends meet. They often work as cashiers, nursing assistants, office clerks, servers, laborers, and security guards. These types of jobs are vital to keeping Indiana’s economy running smoothly, but they do not provide adequate wages to cover the basics of housing, child care, food, transportation, health care, and technology for these ALICE workers and their families.

The number of Indiana households living in poverty rose from 12% in 2007 to 14% in 2010, and then held steady through 2016 before decreasing slightly to 13% in 2018. The total number of households in the state increased 5%, from 2,462,278 in 2007 to 2,592,262 households in 2018. Yet the number of ALICE households in Indiana increased significantly more (52%), with their share of households rising from 16% in 2007 to 24% in 2018. Overall, the percentage of households living below the ALICE Threshold (ALICE and poverty-level households combined), rose from 28% in 2007 to 37% in 2018 (Figure 1).

Figure 1.
Households by Income, Indiana, 2007-2018

ALICE households live in every county in Indiana — urban, suburban, and rural — and they include people of all genders, ages, and races/ethnicities, across all household types. Figure 2 shows that in 2018, the largest numbers of households below the ALICE Threshold were in the largest demographic groups in Indiana. White households accounted for 82% of total households in 2018, and 33% of White households earned below the ALICE threshold. Two other large groups with a high proportion of households below the ALICE Threshold are households headed by someone in their prime working years (ages 25-64) and single or cohabiting households (without children or seniors). Among families with children — another of the state’s biggest groups — married-parent families were the largest subgroup and accounted for 29% of families with children living below the ALICE Threshold.

Another way to examine the data is to look at the proportion of each group that is below the ALICE Threshold. Overall, 37% of households in Indiana had income below the ALICE Threshold in 2018. But many smaller groups had a disproportionately high percentage of families below the ALICE Threshold, including Hispanic and Black households, young households (headed by someone under age 25), and single-female-headed households with children (Figure 3).

Total Households

Sources: ALICE Threshold, 2018; American Community Survey, 2018
TRENDS: HOUSEHOLD DEMOGRAPHICS

A growing number of households live on the edge of the ALICE Threshold. For these households, even a small increase in the cost of housing or a decrease in work hours can mean the difference between being financially stable and being ALICE — or between being ALICE and falling into poverty. In Indiana, 275,093 households (11%) were on the cusp of the ALICE Threshold in 2018, with earnings just above or below it. This matters not only for families, but also for the Indiana economy: Small increases in regular bills like rent, food, or gasoline; a decrease in wages or hours worked; or an unexpected emergency, such as a factory closing or a natural disaster, could destabilize a large number of households.

Indiana is becoming more diverse. Each of the state’s racial and ethnic groups expanded between 2010 and 2018; but the trajectories for population growth and financial hardship among these groups differed. The largest group, White households, is aging, divided between urban and rural areas, and showed the slowest overall growth, increasing by 2%. White households also experienced a 6% decrease in the number of households below the ALICE Threshold.

All other racial/ethnic groups tend to be younger, are more likely to live in urban areas, and experienced larger increases in both total population and number of households below the ALICE Threshold between 2010 and 2018. Black households increased by 10%, and the number of Black households below the ALICE Threshold increased by 9%. Hispanic households increased by 28%, and the number of Hispanic households below the ALICE Threshold increased by 16%. And the smallest group, Asian households, increased by 45%, while the number of Asian households below the ALICE Threshold increased by 44%.

Most of Indiana’s population growth, particularly among non-White groups, occurred in metropolitan areas, especially the Indianapolis-Carmel-Anderson metro area — including Boone, Hamilton, Hancock, and Hendricks counties. In contrast, counties with mid-sized communities and rural areas saw a decline in population. More than one-third of Indiana’s rural counties, which are largely White, lost population in 2018.

Indiana’s household structure continues to change. Married-parent families with children are no longer the most common household type. In 2018, single or cohabiting adults under age 65 with no children under age 18 made up the largest proportion of households in Indiana (47%), as well as the largest share of households below the ALICE Threshold (44%). Nationally, the number of cohabiting adults, in particular, more than doubled between 1996 and 2017, and these partners tend to have higher levels of education and be more racially diverse today than cohabiting adults 20 years ago.

Baby boomers and millennials, the two largest population bubbles, are getting older. This natural aging of the population is increasing the number of seniors as more baby boomers pass the age of 65; boomers are now between the ages of 56 and 74. By 2030, one in five Hoosiers will be a senior citizen. There are three trends among seniors: First, the White population in Indiana will continue to account for an increasing share of the senior population. Second, having lived through a decade of financial challenges since the Great Recession, more Indiana seniors will become ALICE. And third, seniors make up a larger portion of households in rural areas, where they will continue to face additional challenges in access to transportation, health care, and caregiving. A 2020 report on the best and worst place for seniors to live ranked Indiana 33rd out of 50 states, with high scores for affordability, but low scores in access to health care providers, social involvement, and other quality-of-life factors.

As millennials, the other population bubble, get older, the proportion of both college-age students and families with children is declining due to several factors: Millennials have passed traditional college age, are having fewer children, and are waiting longer than previous generations to start a family.

Inequality in income and wealth will continue to rise as wage growth and job stability in high-wage jobs greatly outpace wage growth and stability at the lower end. Nationwide, from the late 1940s to the early 1970s, incomes across the income distribution grew at nearly the same pace. Then, beginning in the 1970s, income disparities began to widen: The average income for the top 1% increased over five times more than that of the middle 60% and over three times more than that of the bottom fifth, from 1979 to 2016. The gap in wealth (savings and assets) is even greater. Unable to save, ALICE families do not have the means to build assets, let alone catch up to those who already have assets, (especially those who have been building assets for generations). ALICE families also face more barriers that, when compounded, create an even bigger wealth gap. These include issues like lower pay for women, racial/ethnic discrimination in homeownership, and student loan debt.
THE COST OF LIVING IN INDIANA

Traditional economic measures systematically underestimate the actual cost of basic needs and their rate of increase over time, concealing important aspects of the local and national economy. To better capture the reality of how much income households need to live and work in the modern economy in each county in Indiana, this Report includes the ALICE Household Budgets. In addition, the Report presents the ALICE Essentials Index, a standardized national measure that captures change over time in the cost of household essentials that ALICE households purchase. Together, these tools provide a more accurate estimate of the cost of living and a clearer way to track change over time.

THE ALICE HOUSEHOLD BUDGETS

United For ALICE provides three basic budgets for all counties in Indiana. Each budget can be calculated for various household types.

- The ALICE Household Survival Budget is an estimate of the minimal total cost of household essentials — housing, child care, food, transportation, health care, and technology, plus taxes and a miscellaneous contingency fund equal to 10% of the budget. It does not include savings, auto repairs, cable service, travel, laundry costs, or amenities such as holiday gifts or dinner at a restaurant that many families take for granted.

- The Senior Survival Budget, new to this Report, adjusts the Household Survival Budget to reflect the fact that seniors have lower food costs than younger adults, travel fewer miles for work and family responsibilities, and have increasing health needs and out-of-pocket health care expenses.

- For comparison to a more sustainable budget, the ALICE Household Stability Budget estimates the higher costs of maintaining a viable household over time, and it is the only ALICE budget to include a savings category, equal to 10% of the budget.

The actual cost of household basics in every county in Indiana is well above the Federal Poverty Level (FPL) for all household sizes and types (Figure 4). For a single adult, the FPL was $12,140 per year in 2018, but the average Household Survival Budget in Indiana was $21,228 per year.11 The average Senior Survival Budget totaled $24,024 per year, primarily due to increased health costs. (Despite having Medicare, seniors have greater out-of-pocket health care costs, largely due to increased spending on chronic health issues like heart disease and diabetes.) And all budgets were significantly lower than the Household Stability Budget, which reached $41,748 per year for a single adult.

The gaps are even larger for families. The FPL for a four-person family was $25,100 in 2018, while the Household Survival Budget for a family with two adults, an infant, and a four-year-old was $60,756.12

The hourly wages needed to support these budgets were $10.61 for the single adult Survival Budget; $12.01 for the Senior Survival Budget; and $30.38 for one worker or $15.19 each for two workers for the Survival Budget for a family of four. To put these budgets in perspective, the median hourly wage for cashiers, one of the top five most common occupations in Indiana, was $9.68 per hour in 2018, or $19,360 if full time, year-round — not enough to support any of the ALICE budgets.

Public assistance programs are based on the FPL, but the FPL is not enough for a household to cover even its most minimal costs, as shown by the comparison to the Household Survival Budget in Figure 4. This means that assistance programs serve far fewer households than actually need assistance, even in a strong economy.

To see the details of each ALICE budget for different household types, visit UnitedForALICE.org/Indiana
Figure 4.
Budget Comparison, Indiana, 2018

Note: The FPL is a total; there is no breakdown of how that amount is allocated by budget category.

THE ALICE ESSENTIALS INDEX

Based on items in the Household Survival Budget, the ALICE Essentials Index measures the change over time in the costs of household essentials — a much narrower definition than the more common rate of inflation based on the BLS Consumer Price Index (CPI). While the CPI covers a large group of goods and services that urban consumers buy regularly (housing, food and beverages, transportation, medical care, apparel, recreation, education, and communication services), the ALICE Essentials Index includes only essential household items (housing, child care, food, transportation, health care, and a smartphone plan). The ALICE Essentials Index is also calculated for both urban and rural areas, while the CPI only tracks inflation based on a select number of metropolitan (urban) counties.

Across the country, the ALICE Essentials Index has increased faster than the CPI over the last decade (Figure 5). From 2007 to 2018, the average annual rate of increase was 3.3% in urban areas and 3.4% in rural areas, while the CPI increased by 1.8%. This difference is primarily due to the fact that the costs of basics, especially housing and health care, have increased, while the costs of other items — notably manufactured goods, from apparel to cars — have remained relatively flat. And while basic household goods were 18% to 22% more expensive in urban areas than in rural areas, those costs increased at nearly the same rate in both areas during this period.

Figure 5.
Consumer Price Index and ALICE Essentials Index, United States, 2007-2018

The difference between these two cost-of-living measures is more than an academic question. The CPI is used to measure inflation and monitor monetary policy. It also determines the rate at which a wide range of government program levels and benefits are increased, including Social Security, veterans’ and Federal Civil Service retirees’ benefits, government assistance programs, the FPL, income tax brackets, and tax credits like the Earned Income Tax Credit (EITC). But the ALICE Essentials Index shows that from 2007 to 2018, the CPI considerably underestimated the increase in the cost of living across the country.
TRENDS: COST OF LIVING

The cost of living for ALICE is growing significantly in both urban and rural areas, often driven by the cost of housing. In Indiana, rising costs in urban areas — such as the Indianapolis-Carmel-Anderson metro area — are due to population growth and increasing demand for low-cost rental units (especially among millennials and seniors). And while the overall cost of living in rural America is lower than in metro areas, expenses — especially housing — are rising at similar rates in both areas. A recent national report calculated that renters who earn Indiana’s minimum wage of $7.25 per hour would have to work 71 hours a week to afford a modest one-bedroom apartment at fair market rate. Adding to the affordable housing crisis, more than 30,000 renter households are evicted statewide each year. Nationwide, households that are severely rent burdened (with rent accounting for more than 50% of their income) are projected to grow by at least 11%, to 13.1 million households, by 2025.16

Commuting times will continue to increase, as will demand for alternative transportation options. High housing costs and urban sprawl push workers farther from their jobs and increase commute times, which has a negative impact on health, job retention, and productivity. These pressures — along with the cost of owning and maintaining a car, which is essential to live and work in most parts of Indiana — will increase demand for both traditional and new public transportation options (e.g., trains and buses, rideshares, and self-driving vehicles).17

The child care industry will face new challenges, and so will parents. As the number of families with children starts to decrease (it fell 5% in Indiana from 2010 to 2018), it will be harder for child care centers to stay in business, making child care more difficult to find and more expensive, especially in less populated areas. Fifty-five percent of Indiana residents live in a child care desert, defined as having no child care providers at all, or so few options that there are three times as many children for each available licensed child care slot. Shortages are even more pronounced in rural areas, where 72% of families have limited access to licensed child care centers.18 With more than two-thirds of mothers with young children in Indiana in the labor force, the need for affordable, quality child care already exists. Since single-parent families are more likely to be below the ALICE Threshold, they will experience the most significant financial hardship in accessing and affording quality child care. According to Child Care Aware, single parents in Indiana pay, on average, 52% of their income for center-based infant child care. Compounding this issue is the fact that low-paid child care workers are ALICE as well (with a median hourly wage of $9.75 in Indiana).19 The overall trend, then, is toward fewer families with children but more who are struggling.

Food insecurity is increasing among young adults and seniors. In 2018, compared to other age groups in Indiana, households headed by adults under the age of 25 were more likely to be below the ALICE Threshold, and they often struggled to put food on the table. For example, reports consistently find higher rates of food insecurity among college students. There is also growing food insecurity at the other end of the age spectrum, with a projected 8 million food-insecure seniors nationwide by 2050. Compared to other seniors, food-insecure seniors are more than twice as likely to have depression, 91% more likely to have asthma, 66% more likely to have had a heart attack, and 57% more likely to have congestive heart failure. Public benefits help but do not eliminate the need for emergency assistance measures, such as food pantries.20

“In 2018, compared to other age groups in Indiana, households headed by adults under the age of 25 were more likely to be below the ALICE Threshold, and they often struggled to put food on the table.”
College students across the country are facing greater challenges in meeting living expenses, despite the fact that increasing numbers of students are working full or part time. Students often rely on multiple sources of financial support, including financial aid, student loans, and assistance from parents or other family members, to cover their living expenses. Yet even with these types of financial help, many students need to work while in school; in particular, more than two-thirds of students enrolled in community colleges work full or part time. In a recent financial wellness survey, 56% of students report paying for college using money from their current employment, and 31% of students pay for college with credit cards, leading to accumulation of increased debt. Working long hours to earn more income comes at a price, as it can interfere with academic performance and ultimately the likelihood of obtaining a degree. Students report that two of the major obstacles to academic success are juggling work with school and other responsibilities and difficulty meeting expenses. For more information, see the 2019 United For ALICE Report, *The Consequences of Insufficient Household Income*.

Gaps in health based on demographic, environmental, and socioeconomic factors will continue to grow. Volatility in health insurance availability and coverage, increasing out-of-pocket costs — even for those with employer-sponsored programs — and shortages of health care providers (especially in rural areas) make it harder for many families to get the health care they need. On a range of measures, including avoidable hospital use and cost, and the disparity in care between high- and low-income patients, Indiana ranked 37th out of 50 states in the Commonwealth Fund's 2018 survey of state health systems. These disparities will grow with new but expensive advances in medicine, compounded exposure to environmental hazards and public health crises for many low-income households, and a persistent context of discrimination and institutionalized racism in Indiana and across the country.

Natural and human-made disasters will continue to impact ALICE households disproportionately. In 2018, many counties in Indiana saw the worst flooding in decades. In addition to heavy rains and severe thunderstorms, a recent report found that tornado activity is expanding east beyond Tornado Alley to Indiana and neighboring states. Across Indiana, the increasing impact of disasters — from floods and wildfires to pandemics — is felt most acutely by ALICE households and their surrounding communities. With minimal job security and little to no savings, ALICE families feel the impact of an economic disruption almost immediately, as hourly paid workers suffer lost wages right away. ALICE households are more vulnerable during natural disasters, as they often live in communities with fewer resources, and their housing is more susceptible to flooding, fire, and other hazards. With no financial cushion, ALICE workers struggle to repair damage, recover from illness, and pay ongoing bills. At the same time, ALICE workers are essential to disaster recovery efforts in both infrastructure repair and health care, and they are often forced to choose between caring for their families and ensuring community recovery. All of these costs are added to the increased risk of physical harm ALICE families face if they cannot afford to flee an oncoming natural disaster or take necessary precautions during a public health crisis.

Financial instability will mean additional costs for ALICE households. The costs of financial instability are cumulative and intensify over time. Skimping on essentials, from food to health care, leads to greater long-term problems (see United For ALICE's 2019 Report *The Consequences of Insufficient Household Income*). Failure to pay bills on time leads to fees, penalties, and low credit scores, which in turn increase interest rates, insurance rates, and costs for other financial transactions (from check-cashing fees to payday cards). Unexpected expenses can intensify these impacts. In 2017, only 62% of Indiana households had set aside any money in the prior 12 months that could be used for unexpected expenses or emergencies such as illness or the loss of a job. Though this was well above the national rate of 42%, it still left more than one third of Hoosiers without any financial cushion. And without enough income to cover current and unexpected expenses, ALICE households cannot save for future expenses like education, retirement, or a down payment on a house.
THE CHANGING LANDSCAPE OF WORK IN INDIANA

ALICE workers play an essential role in Indiana’s economy but have not benefited from many of the state’s recent economic gains — a reality that is not captured by traditional economic measures. This section breaks down labor force data in new ways, and in so doing highlights the challenges ALICE workers face: the declining power of wages to keep up with the cost of living, greater dependence on hourly wages, more than one-third of adults out of the labor force, and increased economic risk for workers.

With a steadily rising GDP and low unemployment, Indiana appeared to have a robust economic profile in 2018, with only 3% of adults actively looking but unable to find work. The state’s central location at the “Crossroads of America” continued to draw companies from the transportation and warehousing industry, while tech companies have migrated to Indianapolis for its affordability — with both industries bringing new jobs to the state. Manufacturing continued to be a leading industry for Indiana in 2018, yet the industry has been declining and is expected to shrink further over the next few years, leading to more job losses. Sectors that are expected to have the strongest job growth include health care, professional and business services, construction, and leisure.

While Indiana realized overall economic gains since the end of the Great Recession as a result of job growth and reduced unemployment, not all Hoosiers benefited. Low-wage jobs increased faster than medium- and high-wage jobs, leaving many households struggling to make ends meet.

Figure 6 illustrates the following trends in wages compared to the cost of living in Indiana from 2007 to 2018:

- Low-wage jobs (dark-blue line) are defined as those paying less than the wage needed for two workers to afford the family Household Survival Budget (which includes costs for two adults, an infant, and a four-year-old). In 2007, this was less than $10.56 per hour; by 2018, the wage required had increased to $15.19 per hour. From 2007 to 2018, the number of low-wage jobs increased by 106% and accounted for 30% of jobs in Indiana in 2018. This shows that even with two earners working full time, it is not only possible, but common for households to fall below the ALICE Threshold.

- Medium-wage jobs (medium-blue line) allow two workers to afford a family Household Survival Budget. In 2007, these were jobs that paid between $10.56 and $21.11 per hour per worker; by 2018, wages needed for these jobs were between $15.19 and $30.38 per hour per worker. The number of medium-wage jobs decreased dramatically during the Great Recession (39%), and have slowly rebounded, so that by 2018, there were only 8% fewer medium-wage jobs than in 2007.

- High-wage jobs (light-blue line) allow one worker to afford a family Household Survival Budget. In 2007, the wage required was $21.11 per hour or more; by 2018, the wage required had increased to $30.38 per hour. The number of high-wage jobs decreased dramatically, by 29% during that period.

“Low-wage jobs increased faster than medium- and high-wage jobs, leaving many households struggling to make ends meet.”
Figure 6.
Number of Jobs by Wage Level, Indiana, 2007-2018

Note: Wage levels are defined by their relation to the Household Survival Budget. Dark blue = Job cannot support family Household Survival Budget with two earners. Medium blue = Job supports family Household Survival Budget with two earners. Light blue = Job supports family Household Survival Budget with one earner.

THE NEW LABOR FORCE

A 2018 overview of the labor status of Indiana’s 5,299,339 working-age adults (people age 16 and over) shows that 64% of adults were in the labor force (blue bars in Figure 7), yet more than half of them were workers who were paid hourly — jobs that tend to be less secure and have fewer benefits. In addition, 37% of adults were outside the labor force (gold bars).34

Figure 7.
Labor Status, Population Age 16 and Over, Indiana, 2018

Note: Data for full- and part-time jobs is only available at the national level; these national rates (51% of full-time workers and 75% of part-time workers paid hourly) have been applied to the total Indiana workforce to calculate the breakdown shown in this figure. Full-time represents a minimum of 35 hours per week at one or more jobs for 48 weeks per year. Many percentages are rounded to whole numbers, sometimes resulting in percentages totaling 99% or 101%.

Sources: American Community Survey, 2018; Federal Reserve Bank of St. Louis, 2018

Though the majority of adults in Indiana were working in 2018 and most households had at least one worker, only 24% of working-age adults had the security of a full-time job with a salary. The rest were paid hourly and/or worked part time.35

Hourly Work and the Gig Economy

Employers’ increasing reliance on hourly workers is typically associated with freelance “gig economy” jobs (like rideshare driving or on-demand delivery), but even traditional jobs are now more likely to be paid by the hour, especially in retail, health care, food service, and construction.36 These workers are more likely to have fluctuations in income, with frequent schedule changes and variation in the number of hours available for work each week/month. They are also less likely to receive benefits, such as health insurance, paid time off, family leave, or retirement benefits, especially if they work fewer than 30 hours per week at a single job.37
Hourly workers are more likely to have multiple sources of income. Traditional measures of employment have focused on the number of jobs held by a worker; for example, BLS estimates that only 5% of workers held two or more jobs in 2018. However, in the modern economy, where many workers have their own small business, are consultants, or are contingent, temporary, freelance, or contract workers, a worker may have many sources of income that are not necessarily considered a “job.” In 2019, nearly half (45%) of working adults reported having a side gig outside of their primary job.

In comparison with hourly workers, salaried workers are paid an annual amount at regular pay periods, and usually receive benefits. Nationally, employers spent an average of 31% of compensation on benefits in 2018; not providing these represents significant savings to the employer. As a result, even traditional jobs are morphing as employers shift the financial risk of changes in supply and demand to employees. While this is true throughout the economy, it is especially concentrated in lower-wage positions — the jobs most accessible to ALICE.

Who is Out of the Labor Force?

Of adults 16 years and older in Indiana, 16% were out of the labor force in 2018 because they were retired and another 21% were out of the labor force for other reasons (gold bars in Figure 7). This totals 37% of adults outside the labor force — a number that has remained relatively consistent since 2010.

Many of those out of the labor force had stopped looking for work for a variety of reasons, such as scheduling, transportation, or child care issues. They were not included in the state’s low unemployment rate, which only counts adults actively looking for work. In the 2018 economy, those out of the labor force had proven to be a large reserve of potential workers able to be drawn back into the labor force with only slightly higher wages — in effect, keeping wages low. In previous periods of low unemployment, employers have had to offer much higher wages to attract workers back into the labor force or away from other businesses.

One of the largest groups of adults traditionally out of the labor force is retirees (age 65 and over and not working). In Indiana in 2018, they accounted for 16% of the population over age 16 — an unusually high percentage, in part due to the baby boomer generation aging into retirement. This number does not include the increasing number of seniors who are still working; in 2018, 22% of seniors in Indiana were still in the labor force.

Those under 65 and not working accounted for another 21% of the population over age 16, and they were out of the labor force for a variety of reasons, the two most common being:

- **School:** Nationally, 77% of high school students and 52% of college students did not work in 2018. At these rates, non-working students in Indiana would account for approximately one-third (34%) of the state’s working-age adults out of the workforce.

- **Health:** Adults with one or more health issues — an illness or disability that makes it difficult to get to work, perform some job functions, or work long hours — accounted for one-quarter of those out of the labor force in Indiana in 2018.

The remainder of adults were out of the labor force for other reasons, including family caregiving responsibilities or limited access to transportation or child care. For women 25 to 54 years old, the most common reason for not working in 2018 was in-home responsibilities — caring for children, but also, as the population of Indiana ages, caring for an aging parent or a family member with a disability or chronic health issue.
ALICE JOBS: MAINTAINING THE ECONOMY

While national conversations about work often focus on the economic importance of the “innovation” sector and its high-paying jobs, the reality is that the smooth functioning of the national and Indiana economies relies on a much larger number of occupations that build and repair the infrastructure and educate and care for the past, current, and future workforce. The workers in these jobs are described as “Maintainers” by technology scholars Lee Vinsel and Andrew Russell, and they are primarily ALICE. To better understand where ALICE works, we elaborate on Vinsel and Russell’s concept by breaking down all occupations in Indiana into two occupational categories, each with two job types: the lower-paying Maintainer occupations, composed of Infrastructor and Nurturer jobs; and the higher-paying Innovator occupations, composed of Adaptor and Inventor jobs.

DEFINITIONS

Maintainer Occupations:

Infrastructors build and maintain the physical economy (construction, maintenance, management, administration, manufacturing, agriculture, mining, transportation, retail).

Nurturers care for and educate the workforce (health and education, food service, arts, tourism, hospitality).

Innovator Occupations:

Adaptors implement existing tools or processes in new ways, responding to opportunities and changing circumstances (managers, industrial and organizational psychologists, analysts, designers, technicians, and even policymakers).

Inventors devise new processes, appliances, machines, or ideas. Before World War II, most inventors were independent entrepreneurs. Today, they are most likely engineers and scientists working in research & development, and, in some cases, higher education.

The largest employment sectors in Indiana are Maintainer occupations. The single largest industry in 2018, with 598,300 employees, was trade, transportation, and utilities, which is comprised of Infrastructor jobs. The second largest, also comprised of Infrastructor jobs, was manufacturing, with 542,900 employees. Education and health services, mainly comprised of Nurturer jobs, followed, with 478,400 employees. Each of these industries have large shares of ALICE workers. There are far fewer jobs in Innovator occupations (Adaptors and Inventors).

When stacked together, Indiana’s occupations form a pyramid that reveals the critical role of Maintainer jobs — the jobs most accessible to ALICE — in the state economy (Figure 8). The majority of Maintainer jobs (67% of Infrastructor jobs and 63% of Nurturer jobs) pay less than $20 per hour — a wage that, if full time, year-round, provides a maximum annual salary of less than $40,000, which is $20,756 less than the family Household Survival Budget of $60,756. By comparison, almost all Adaptor and Inventor occupations pay more than $20 per hour.
The precarious nature of ALICE workers’ jobs is reinforced by the powerful relationship between low wages and the high risk of jobs becoming automated (defined as having a greater than 50% chance of being replaced by technology in the next decade). Jobs that pay less than $20 per hour are more likely to be replaced by technology compared to higher-paying jobs. This is especially true for Maintainer occupations, where most jobs pay less than $20 per hour and 87% of these low-paying jobs are at a high risk of automation. By comparison, only 36% of Maintainer jobs that pay more than $20 per hour are at that level of risk (Figure 9).
Figure 9. Occupations by Type and Risk of Automation, Indiana, 2018

Maintainer Jobs

<table>
<thead>
<tr>
<th>Salary Range</th>
<th>Total Jobs</th>
<th>High Risk of Automation</th>
<th>Low Risk of Automation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Paying Less Than $20/hour</td>
<td>1,884,520</td>
<td>13%</td>
<td>87%</td>
</tr>
<tr>
<td>Paying More Than $20/hour</td>
<td>986,810</td>
<td>64%</td>
<td>36%</td>
</tr>
</tbody>
</table>

There are also differences in salary and risk of automation based on the type of Maintainer job. Among Infrastructor jobs, 95% of jobs that pay less than $20 per hour are at risk of automation, compared to 54% of those that pay more than $20 per hour. Among Nurturer jobs, the discrepancy is even greater: 67% of jobs that pay less than $20 per hour are at risk of automation compared with 2% of those that pay more than $20 per hour. Education level also impacts risk of automation; jobs that require only a high school diploma are more than 200% more likely to be at risk of automation compared to jobs that require a bachelor's degree.

TRENDS: THE LANDSCAPE OF WORK

Economic growth will be led by the non-traditional work and small businesses of the gig economy. As much as 94% of U.S. net employment growth in the last decade has come from alternative or contingent labor, according to a National Bureau of Economic Research report. With an increasing number of workers who are contractors, work in small businesses, or rely on a combination of side gigs, the number of people experiencing gaps in income and going without benefits will also rise. Millennials are leading the way in this trend, with 48% nationally saying they earn income on the side (i.e., in addition to what they consider their primary employment), compared to 28% of baby boomers. Since 2012, Indianapolis began to see a rise in the number of gig workers, largely because of gig-economy apps like Uber, DoorDash, and Airbnb, leading to more freelance jobs than ever before. While some workers are drawn to the flexibility, these arrangements are more volatile than traditional jobs. Freelancers bear the brunt of changes in demand, the price of materials, and transportation costs, as well as impacts related to cyberattacks, natural and human-made disasters, and economic downturns.
The rise of automation will require a workforce with more digital skills. Rather than being replaced outright, many jobs, across all job types, will require an increasing ability to incorporate new technologies, work with data, and make data-based decisions. ALICE workers will need to gain new skills rapidly, and that will require more on-the-job training, more flexibility to change career paths, and different kinds of education providers. The benefits of increased technology will include improved connectivity for small businesses in rural areas, accuracy in work such as pharmaceutical pill dispensing, and reduced risk of injury for workers such as warehouse packers and long-distance drivers.

The number of low-wage jobs will continue to increase, despite automation. Even though most jobs will change and evolve, a large portion will remain low-wage. For example, the wages in many Maintainer jobs are so low that it would be more expensive to automate them. Other low-wage jobs in areas like education and health care require employees to be on-site and are difficult to fully automate (although these workers will still have to learn to work with technology). From 2016 to 2026, the occupation projected to have the largest number of new jobs in Indiana is food preparation and serving workers; the median wage for these jobs in 2018 was $9.05 per hour, which was not enough to support the single-adult or family Survival Budgets. Of the state’s top 20 growth occupations, 60% will pay less than $15 per hour, 37% will not require any formal educational credential at all, and 30% will require only a high school diploma.

Students will continue to be a significant part of the labor force. As more families face financial hardship and the cost of college continues to rise, more students will have to work while in school. Nationally, 20% of high school students, 41% of full-time college students, and 82% of part-time college students had a job in 2017. What’s more, despite many students being employed, 45% of college students who completed the largest annual survey of basic college needs reported having experienced food insecurity in the previous month, and 56% had experienced housing insecurity in the prior year. And even with more students working, student debt will continue to increase as more students from lower-income families attend college and costs continue to rise. In Indiana, 57% of college students who graduated in 2018 were in debt with an average loan of $29,064, an 8% increase from 2010.
NEXT STEPS: DATA FOR ACTION

The ALICE data highlights significant problems in the Indiana economy in 2018: stagnant wages, a rising cost of living, and 37% of the state’s households unable to afford even the most basic budget. However, this data can also be used to generate solutions to these problems that help ALICE households and create equity across communities. The measures of cost of living, financial hardship, and changes in the labor force presented in this Report can help stakeholders ask the right questions and make data-driven decisions. This data can help policymakers and community organizations identify gaps in community resources, and it can guide businesses in finding additional ways to assist their workforce and increase productivity — both in times of economic growth and in periods of economic recovery.

This section of the Report maps the 2018 ALICE data, showing gaps in resources to help direct assistance and fill immediate needs. When analyzed in relation to broader data on health, education, and social factors, these maps help focus solutions on underlying causes of hardship, and they also highlight areas of success.

IDENTIFYING GAPS

ALICE households often live in areas with limited community resources, making it even more difficult to make ends meet. The lack of some resources has immediate and direct costs. For example, without public transportation or nearby publicly funded preschools, ALICE families pay more for transportation and child care. Other costs, such as the consequences of limited access to health care providers, open space, or libraries, accumulate over time.

With the ALICE data tools, stakeholders can map where ALICE lives along with the location of community resources — such as public libraries or disaster-relief services — to identify gaps by town, ZIP code, or county (Figure 10). This data can help stakeholders answer targeted questions, including the following:

Do ALICE households have access to libraries?

Access to public libraries is especially important for ALICE families because libraries provide information on social services and job opportunities, free internet and computer access, and a range of free programs, community meetings, and even 3-D printers. After a natural disaster, libraries serve as second responders, providing electricity, internet access, charging stations, heat or air conditioning, and current information on recovery efforts. In lower-income communities, the library can provide a safe and inclusive place for individuals and families. A 2019 Gallup Poll found that lower-income households (earning less than $40,000 per year) visit the library more frequently than average- and higher-income households.

There are 236 public library systems with 432 branches across Indiana’s 92 counties, shown in gold dots in Figure 10 (and in an interactive feature on UnitedForALICE.org/Indiana). This data can help stakeholders identify where there are gaps in needed services (such as in areas with a high percentage of ALICE households but few or no libraries) and what type of intervention might be most helpful. For example, areas with a small population but a high percentage of ALICE households may benefit more from mobile library services than a new brick-and-mortar building, or library services (like free computers) could be offered in other public buildings.
Figure 10.
Library Locations and Households Below ALICE Threshold, Indiana, 2018

Are the needs of ALICE households met after a natural disaster?

Mapping where ALICE households live in relation to the impact of natural disasters, such as floods, hurricanes, or wildfires, can help first and second responders meet critical needs. Disasters directly threaten the homes of ALICE families since more affordable housing is often located in vulnerable areas. The jobs where ALICE works are also more at risk, since low-wage and hourly paid jobs are more likely to be interrupted or lost. In addition, ALICE households have few or no savings for an emergency to begin with, and their communities often have fewer resources to assist households.65

Knowing where ALICE households live can help federal, state, and local governments target preparation, response, and assistance for natural disasters, and help companies plan where to deploy their workforce and support. Because ALICE households and communities do not have the same resources as their wealthier counterparts, namely insurance or savings, they will need more assistance over a longer period of time to recover. Strategies will vary by rural or urban context, the quality of the housing stock, and the age composition of the community (with the young and the elderly more dependent on care).66

UNDERSTANDING ALICE: HEALTH, EDUCATION, AND SOCIAL FACTORS

In most contexts, having a low income is associated with lower levels of education, higher rates of unemployment, and poorer health. Communities that have been able to disrupt that association can provide important insights on how to change environments or policy to support ALICE households. By tracking where ALICE lives with other indicators, it is possible to identify counties that have overcome a challenge or bucked a trend. Stakeholders can then learn from these examples and adapt those solutions to their own areas.

Tracking relationships between ALICE households and other variables at the county level — in areas such as technology or health — can also help stakeholders ask important questions and target resources where they can have the greatest impact. To see interactive maps of socioeconomic indicators in Indiana, visit our website: UnitedForALICE.org/Indiana

Here are two possible questions:

Is internet access related to income?

Access to digital technology has exploded over the last three decades: By 2017, 91% of U.S. adults owned a computing device and 81% had a broadband internet subscription. In Indiana, only 78% of households had access to the internet at home in 2018. Technology has also become more important for work, education, community participation, and, crucially, disaster response and recovery.

But access to technology still varies by income and geography. For many families, that lack of access translates directly to reduced job opportunities, educational opportunities, health care access, and financial tools. For example, low-income adults are more likely to use their phones to search and apply for jobs; nationally, 32% of smartphone users with income below $30,000 have applied for a job on their phone, compared with 7% of smartphone users with income above $75,000. Although smartphone technology is constantly improving, many tasks are still more difficult to complete on the small screen of a smartphone as opposed to a computer (e.g., word processing, filling out applications, editing spreadsheets), and many websites still do not have a mobile version, making navigation time-consuming and difficult, or sometimes impossible. Households without internet access are also at greater risk of being undercounted in the 2020 Census, when they may need government programs and services the most.

In Indiana, only 78% of households had access to the internet at home in 2018.

This high usage of smartphones for a critical task indicates that many low-income households have limited access to the internet at home. In Indiana, 36% of households with income below the ALICE Threshold do not have an internet subscription, compared with only 11% for households above the ALICE Threshold. Rates also vary widely by location: The counties with the lowest access rates and lowest income are in rural areas, where as many as 43% of households below the ALICE Threshold do not have an internet subscription. Two-thirds of rural small businesses in the state also report that poor connectivity negatively impacts their bottom line, and that improving access would lead to increased sales and the creation of new jobs. Identifying these gaps can help businesses and government provide more resources to libraries, establish training centers, or target low-cost internet plans.
Are drug overdoses driven by income?

Indiana, like many states across the country, has experienced an increase in drug overdose deaths, largely due to an increase in deaths from opioid use. In the last two decades, more than 15,000 people in Indiana died from drug overdoses, with nearly two thirds (63%) involving an opioid.73

Several national studies have suggested that counties with the worst economic prospects have the highest rates of substance use disorders and drug-overdose related hospitalizations and deaths. Yet that relationship varies across states, as people of all incomes, geographies, ages, and races/ethnicities suffer from substance use disorders.74 In Indiana, overdose deaths have been reported in both urban and rural counties, but rural counties have experienced higher incidences, particularly Fayette, Scott, and Wayne counties. In 2018, while some of the highest numbers of overdose deaths occurred in counties that also had a high percentage of households below the ALICE Threshold, overall there was not a significant relationship between income (defined by the percentage of households below the ALICE Threshold) and drug overdose deaths across Indiana’s counties.75

Understanding which communities have been hardest hit by substance use disorders can help planners and stakeholders see the complex ways in which addiction and financial hardship interact. Although economic standing is not always a risk factor for drug addiction in Indiana, the consequences of addiction hit low-income families harder. The impact of addiction and substance use disorders on families often means a decline in their financial position, causing many families to become or remain ALICE. A family’s income may be reduced if addiction reduces an adult’s ability to work, and these families often have substantial health care costs. For example, addiction treatment ranges from $1,176 to $6,552 per month nationally. And lower-income families may not have access to such treatment programs, which only prolongs and compounds the outcomes of addiction. Substance use disorders take a toll on the stability of families and marriages, on parenting, and on the physical and mental health of family members.76 Finally, the opioid crisis has had a significant impact on the Indiana economy, costing the state an estimated $3.1 billion in 2019.77 For all of these reasons, there can be huge value for community stakeholders in mapping where ALICE lives with drug overdose deaths to identify communities that have the greatest need but the fewest resources to address addiction-related problems.78

THE BENEFITS OF MOVING TOWARD EQUITY IN INDIANA

The strength of the Indiana economy is inextricably tied to the financial stability of its residents. The more people participate in a state’s economy, the stronger it will be. In 2018, when the national economy was often described as “strong,” the reality was that nearly a million households — more than one-third of all households in the state — struggled to support themselves. If all households earned enough to meet their basic needs, not only would each family’s hardship be eased, but the Indiana economy would also benefit substantially. This is true in times of economic growth, and it becomes even more important during a period of crisis and recovery.
To better understand the extent to which financial hardship is a drain on a state's economy, this section provides an estimate of the benefits of raising the income of all households to the ALICE Threshold. While lifting family income would be an enormous undertaking, the statewide benefits of doing so make a compelling case for pointing both policy and investment toward that goal.

**Based on 2018 data, the economic benefit to Indiana of bringing all households to the ALICE Threshold would be approximately $57.5 billion, meaning that the state GDP would grow by 16%, which is approximately the size of Indiana's durable goods manufacturing industry** (Figure 11). This is based on three categories of economic enhancement:

**Earnings:** Indiana's 2018 GDP reflected earnings of $17.4 billion by the state's households below the ALICE Threshold. Bringing all households to the ALICE Threshold would have a two-fold impact:

- **Additional earnings:** $21.1 billion statewide.
- **Multiplier effect:** Studies show that almost all additional wages earned by low-wage workers are put back into the economy through increased consumer spending, which in turn spurs business growth.\(^7^9\) Building on economic calculations used by Moody's Analytics, this estimate assumes an economic multiplier of 1.2, meaning that a $1 increase in compensation to low-wage workers leads to a $1.20 increase in economic activity. In Indiana this increased economic activity would be valued at $25.3 billion.\(^8^0\)

**Tax revenue:** Indiana's 2018 GDP reflected tax revenue of $726 million from the state's households below the ALICE Threshold. Bringing all households to the ALICE Threshold would have a two-fold impact:

- **Additional tax revenue:** With additional earnings, there would also be additional taxes paid and reduced usage of tax credits such as EITC for low-income earners, totaling an additional $795 million in tax revenue for Indiana.
- **Multiplier effect:** Additional state tax revenue gives state and local governments the opportunity to make investments that matter most to the well-being of residents and businesses — from tax cuts for small businesses to improvements in infrastructure, including health care and education — that can yield a high return on investment. Based on work by the Congressional Budget Office and Moody's Analytics, the estimated multiplier is 1.44, which would mean an added $1.1 billion in economic activity in Indiana.\(^8^1\)

**Community spending:** Indiana's 2018 GDP reflected community spending of $20 billion on assistance to the state's households below the ALICE Threshold.\(^8^2\) When all households can meet their basic needs, this spending can be reallocated to projects and programs that help families and communities thrive, not just survive:

- **Indirect benefits:** Added value to the state GDP would come in the form of indirect benefits associated with increased financial stability. These benefits include improved health (and reduced health care expenditures), reduced crime and homelessness, and greater community engagement. Figure 11 uses the very conservative estimate of an added $9.2 billion (or 2.5% of the state GDP, which is the estimated cost of childhood poverty alone).\(^8^3\) This is still far short of the total indirect benefits of bringing all households to the ALICE Threshold, as it does not include benefits for adults or the direct impact of redeploying private and nonprofit spending currently used to alleviate poverty.\(^8^4\)

Benefits for Households and Local Communities

In addition to the economic benefits to the state if all households had income above the ALICE Threshold, there would be a significant number of positive changes for families and their communities. Our 2019 companion Report, *The Consequences of Insufficient Household Income*, outlines the tough choices ALICE and poverty-level families make when they do not have enough income to afford basic necessities, and how those decisions affect their broader communities. By contrast, Figure 12 outlines the improvements that all Indiana families and their communities would experience if policies were implemented that moved all households above the ALICE Threshold.
### Figure 12.
The Benefits of Sufficient Income

<table>
<thead>
<tr>
<th>If households have sufficient income for...</th>
<th>Impact on ALICE</th>
<th>Impact on the Community</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Safe, Affordable Housing</strong></td>
<td>Improved health through safer environments and decreased stress, improved educational performance and outcomes for children, greater stability for household members, a means to build wealth for homeowners</td>
<td>Less traffic, lower health care costs, better maintained housing stock, lower crime rates, less spending on homelessness/social services</td>
</tr>
<tr>
<td><strong>Quality Child Care and Education</strong></td>
<td>Improved academic performance, higher lifetime earnings, higher graduation rates, improved job stability/access for parents, better health</td>
<td>Decreased racial/ethnic and socioeconomic performance gaps, decreased income disparities, high return on investment (especially for early childhood education)</td>
</tr>
<tr>
<td><strong>Adequate Food</strong></td>
<td>Decreased food insecurity, improved health (especially for children and seniors), decreased likelihood of developmental delays and behavioral problems in school</td>
<td>Lower health care costs, improved workplace productivity, less spending on emergency food services</td>
</tr>
<tr>
<td><strong>Reliable Transportation</strong></td>
<td>Improved access to job opportunities, school and child care, health care, retail markets, social services, and support systems (friends, family, faith communities)</td>
<td>Fewer high-emissions vehicles on the road, more diverse labor market, decreased income disparities</td>
</tr>
<tr>
<td><strong>Quality Health Care</strong></td>
<td>Better mental and physical health (including increased life expectancy), improved access to preventative care, fewer missed days of work/school, decreased need for emergency services</td>
<td>Decreased health care spending, fewer communicable diseases, improved workplace productivity, decreased wealth-health gap</td>
</tr>
<tr>
<td><strong>Reliable Technology</strong></td>
<td>Improved access to job opportunities, expanded access to health information and tele-health services, increased job and academic performance</td>
<td>Decreased “digital divide” in access to technology by income, increased opportunities for civic participation</td>
</tr>
<tr>
<td><strong>Savings</strong></td>
<td>Ability to withstand emergencies without impacting long-term financial stability and greater asset accumulation over time (e.g., interest on savings; ability to invest in education, property, or finance a secure retirement)</td>
<td>Greater charitable contributions; less spending on emergency health, food, and senior services</td>
</tr>
</tbody>
</table>

Note: For sources, see Figure 12: Sources, following the Endnotes for this Report
In addition to the benefits listed in Figure 12, greater financial stability and having basic needs met can reduce the anxiety that comes from struggling to survive, or not having a cushion for emergencies, and it also leaves more time to spend with loved ones and to give back to the community — all of which contribute to happiness and improved life satisfaction.86

Having money saves money: Having enough income means that households can build their credit scores and avoid late fees, predatory lending, and higher interest rates.87 That, in turn, means that ALICE families have more resources to use to reduce risks (e.g., by purchasing insurance), stay healthy (e.g., by getting preventative health care), or save and invest in education or assets that could grow over time (e.g., buying a home or opening a small business). Instead of a downward cycle of accumulating fees, debt, and stress, families can have an upward cycle of savings and health that makes them even better able to be engaged in their communities and, in turn, enjoy a reasonable quality of life.

For communities, this leads to greater economic activity, greater tax revenue, lower levels of crime, and fewer demands on the social safety net, allowing more investment in vital infrastructure, schools, and health care.88 Strengthening communities by strengthening ALICE families means a higher quality of life for all.
ENDNOTES

3 Households on the cusp are defined as those with income in the Census income bracket above and below the ALICE Threshold. Income brackets begin with Less Than $10,000/Year; they increase in $5,000 intervals from $10,000 to $50,000/Year; then they extend to $50,000-$60,000/Year, $60,000-$75,000/Year, $75,000-$100,000/Year, $100,000-$125,000/Year, and $125,000-$150,000/Year.

64 Indiana Library Federation with support from Indiana State Library. (2020, April).

80 Note: While there are increased costs to employers for paying higher wages — which may be passed on to consumers — these impacts primarily occur when wages are increased for jobs with wages well above the Household Survival Budget (See Congressional Budget Office, 2019).

Congressional Budget Office. (2019, July 8). The effects on employment and family income of increasing the federal minimum wage. Retrieved from https://www.cbo.gov/publication/55410

81 Note: The tax calculations include only state taxes, not federal or local. The Congressional Budget Office estimates the impact of tax cuts targeted at lower- and middle-income people and achieved without borrowing as high as 1.5; Zandi estimates the multiplier for increased infrastructure spending at 1.44. This calculation uses the conservative estimate of 1.44.

The National Academies of Sciences, Engineering, and Medicine analyzes the cost of childhood poverty and estimates that reversing it would add 5.4 percent to the state GDP. To be conservative, this analysis uses Holzer’s estimate that childhood poverty costs 2.5 percent of GDP in related health and criminal justice expenses.
